

[illegible]

system for generating printed mail pieces, starting with a printer for printing; a processing device for converting mail pieces into mail pieces; a control unit for controlling the processing device, and memory. The memory contains the control unit for processing the received print file, and representation code for the instructions of the processing code to be represented in form. The representation code is editable for changing the representations of the processing instructions and the processing code. Alternatively, the memory can contain subroutines with which processing subroutines are composed which differ from each other at least as to the instructions included therein, and which are each associated with corresponding processing code. Also described is a system.
